

My laboratory

PARIS - FRANCE - June 7, 2012

We heart projects is proud to announce the release of **My laboratory, a puzzle game for iPhone**. In this game, players embody a scientist who leave our planet to create an entire colorful new world outta space.

To reach his goal, he has **4 basic elements** (air, earth, fire and water) he must combine to discover new ones, for example metal, cars, birds, beer and even a nyancat and a double rainbow. From this point, players can create up to 200 illustrated elements by mixing in a logical way. Earth + earth would make hills, earth + water would make mud etc. But mud + hills won't do anything so that brings the player to think of what to do before doing it.

Great universe and design

My laboratory is a fresh designed game, with a clean and neat interface. It features a powerful drag and drop system which makes the game very easy to use.

Players will enjoy its 200 original elements and sure want to find them all. Some elements are really important to continue, for example: energy, submarine volcano, engine, animals, seeds... When important elements are found, it unlocks achievements which are cool illustrated clues that help to discover other awesome elements.

All that work is an original creation and we are going to make goodies of it.

New indie production

My laboratory is an independent production made by 3 passionate people from France. It was a hard work but the result is nice and beautiful vast universe.

Casual game and reflexion

My laboratory is a casual game, but not a stupid one. Players will have to brainstorm hard to win. It is logical and players will enjoy it, especially when they will find the unicorn :D

This is the perfect game to relax at the beach while getting a nice tan...

200 elements to discover!
